

**FINLAY MINERALS LTD.
MANAGEMENT DISCUSSION AND ANALYSIS
FOR THE YEAR ENDED DECEMBER 31, 2015**

Introduction

This management's discussion and analysis is intended to supplement the audited financial statements and the financial condition and operating results of Finlay Minerals Ltd. (the Company or "FYL") for the year ended December 31, 2015. The discussion should be read in conjunction with the audited financial statements of the Company and the notes thereto for years ended December 31, 2015 and 2014. The audited financial statements are prepared in accordance with International Financial Reporting Standards ("IFRS") and include the operating results of the Company. Unless expressly stated otherwise, all financial information is presented in Canadian dollars. This information is current to April 29, 2016.

Operations

The Company is focused on the exploration for gold-rich copper porphyry, epithermal gold, and mesothermal silver-copper targets in northern British Columbia, Canada. Details of the Company's properties in the Toadogone (Atty, Pil, & Gold) and the Silver Hope Property in Houston, BC can be found in news releases and on the Company website at www.finlayminerals.com.

In the fourth quarter of 2015, work consisting of soil and rock sampling was completed on both the Atty and Pil Properties.

The management team is lead by John Barakso, M.Sc., Geochemistry, who has 40 years of exploration experience and success in northern British Columbia. Mr. Barakso, as a member of the Kemess & Equity Silver deposits discovery teams in the 1960's with Kennco Explorations (Western) Ltd., has focused his attention in the Toadogone over the last 20 years, accumulating key properties now within Finlay Minerals Ltd. Additional members of the management team are Robert F. Brown, P.Eng. President & CEO and Warner Gruenwald, P.Geo, Vice President, Exploration who each have over 30 years in the mineral exploration field.

Silver Hope Property:

There was no exploratory work conducted on the Silver Hope in the fourth quarter of 2015.

Previous Quarters relating to the Silver Hope Property

On February 25, 2015, the Company announced the results of a three hole drilling program (1,200 meters) conducted in late 2014 on its 100%-owned Silver Hope Property located southeast of Houston, B.C. and immediately south of the former Equity Silver Mine. The Silver Hope is contiguous with the southern boundary of the past producing Equity Silver Mines Property (33,800,000 tonnes @ 0.4% copper, 64.7g/t silver, and 0.46g/t gold from open pit and underground mining) and covers prospective stratigraphy for discovery of stratabound copper-silver-gold mineralization.

The drill program highlights and significant intersections are outlined below:

- **SH14-02 intersected 61.25m of 0.05g/t Au, 55.29g/t Ag, 0.29% Cu with a CuEQ of 0.90%**
including 10.25m of 0.19g/t Au, 318.7 g/t Ag, 0.88% Cu with a CuEQ of 4.32%
- **SH14-03 intersected 7.40m of 0.17g/t Au, 25.89g/t Ag, 0.29% Cu with a CuEQ of 0.69%**
intersected 90.70m of 0.04g/t Au, 8.79g/t Ag, 0.15% Cu with a CuEQ of 0.28%
including 8.25m of 0.03g/t Au, 17.30g/t Ag, 0.40% Cu with a CuEQ of 0.60%

For reference to the Drill Hole Location Map of the Silver Hope Property, please go to the Company's home page at www.finlayminerals.com

Notes:

1. Copper Equivalent (CuEQ) is calculated using the following metal prices: Gold: \$1,200/oz USD; Copper: \$2.50/lb USD; Silver; \$16.00/oz USD. Assumption includes 100% metallurgical recovery and net smelter returns.
2. All lengths are reported as core length (meters).
Results reported are weighted averages with no top cutting and no internal waste.
3. Most samples are from 1 to 3 meters long. Precious metals range from <0.01g/t to 1.125g/t (Au) and 1.0 to 1,270 g/t (Ag).
4. Finlay employs a rigorous quality assurance/quality control (QA/QC) program on the Silver Hope Property that includes the regular insertion of certified reference standards and blanks along with the collection of duplicate samples.
5. Warner Gruenwald, P.Geo, Vice President, Exploration for Finlay Minerals Ltd., is the Qualified Person as defined by National Instrument 43-101 and he has prepared the scientific and technical

The 2014 Program Details are as follows:

Drill hole SH14-01 (350 m) targeted a large, deep Induced Polarization (IP) anomaly along the southern projection of the East Horizon Zone. Thick sequences of interbedded, volcanoclastic rocks, pyritic sediments and graphite were intersected. A few (<5m) zones of geochemically anomalous arsenic, silver, lead and zinc were identified. The sulphide – graphite content is believed to be the cause of the IP anomaly.

Drill hole SH14-02 (371 m) tested a strong IP chargeability anomaly delineated from surface to 400 meters deep in the Gaul Zone, the southernmost of the three Main Horizon mineral deposits. Andesitic volcanic and conglomeritic rocks with variable amounts of pyrite, chalcopyrite and localized tetrahedrite, galena and sphalerite were intersected down hole to nearly 300 meters. Two distinct, wide intervals of copper and silver mineralization including some higher grade zones were identified. Although the upper half of the hole was situated between two historic holes, SH14-02 yielded a longer and higher grade intercept. The lower mineralized intercept in this hole was below any of the nearby historic holes in this zone. The sulphide content is believed to be the cause of the strong IP anomaly.

Drill hole SH14-03 (473 m), located 120 meters west of hole SH11-12 (76 meters @ 0.43g/t gold, 29g/t silver and 0.20% copper), was drilled to test the down dip extent of this new Main Deep Horizon mineralization. Sulphide mineralization was found throughout much of the hole. Sulphide-rich breccias were intersected and appear similar, albeit narrower than those up dip in SH11-12. Extensive and often intense alteration marked by silicification, quartz veining and sericite are commonly associated with pyrite, chalcopyrite and localized tetrahedrite, arsenopyrite and sphalerite. The overall extent of mineralization and alteration is however, substantially more widespread than in SH11-12. This zone is open along strike (north-south) and to depth.

Analytical data reveals multiple zones of mineralization with the most significant beginning at a down hole depth of 251 meters. Gold and silver content were less than in SH11-12 likely due to less extensive sulphide-rich breccia and fractured zones. As with SH11-12, this hole contains anomalous amounts of arsenic, bismuth and tellurium. The bottom eleven meters of this hole differs markedly from SH11-12 due to the distinctly anomalous levels of silver, bismuth, molybdenum, tellurium and tungsten.

The 2014 drilling continues to demonstrate the presence of copper-silver and gold mineralized zones along the Main and Main Deep Horizon in a geological setting similar to the former Equity Silver Mine. The Company's work has now extended the strike length of these mineralized horizons to 1.73 km. Further exploratory drilling is warranted as these mineralized zones are open along strike and to depth.

The Silver Hope Property has been the site of several successful exploration programs by the Company. A brief outline of the recent programs follows:

Early exploration in the region and the Silver Hope property focused on Equity Silver Mine type Cu-Ag deposits. In 2010 and 2011 however exploration at Silver Hope resulted in the discovery of a previously unknown but sizable Cu-Mo porphyry referred to as the WEST Horizon. This was exemplified by drill hole SH11-05 (602.0m) that intersected good porphyry mineralization from top to bottom. Several other holes also intersected long intervals of continuous Cu-Mo mineralization.

The 2010 and especially the 2011 drilling programs were also successful in the discovery of mineralization beneath the known mineral occurrences and well below the depths of historic drilling. This was exemplified by drill hole SH11-12 that returned 76 meters @ 0.43g/t gold, 29g/t silver and 0.20% copper. This very significant intersection also had a distinct geochemical signature thought to be related to a deep magmatic (intrusive) source. Such discoveries have identified the potential for deep polymetallic replacement-type mineralization along a five kilometre "mine structure" (i.e. Equity Silver South). The Company refers to this mineralization at Silver Hope as the MAIN Deep Horizon.

The 2011 program also resulted in the discovery of high-grade structural-related mineralization in SH11-08 (2.0m @ 498g/t silver and 0.22% copper) in the EAST Horizon. Compellingly, the EAST Horizon has further demonstrated very high pathfinder soil geochemistry as well as a prominent deep gravity anomaly. The EAST Horizon is postulated to be related to a deep intrusive source not yet intersected by drilling.

In early 2012 the Company completed a property-scale detailed airborne ZTEM geophysical survey. Multiple ZTEM targets were identified over a 5 by 7 kilometer area. The Company was able to verify many of the ZTEM targets with pre-existing ground Induced Polarization (IP) surveys, and core drilling. Some areas required detailed ground follow-up with geological mapping, soil sampling, and further geophysics to develop drill targets. The positive results of the property-wide ZTEM survey propelled the Company to stake additional ground expanding the size of the Silver Hope Property by 54% to 9,736 ha or 97.36 square kilometers.

In 2013 a field program of geological mapping, soil and rock sampling targeted the ZTEM anomalies. The work eliminated several of the targets while confirming potential on targets proximal to the West, Main and East Horizons. This work was followed later in the year with a deep IP survey south of drill hole SH11-12. Strong IP chargeability anomalies were identified at the south end of the East Horizon and proximal to the historic Gaul zone situated along the Main Deep Horizon.

In the first quarter of 2014, the Company completed a review of its 2013 field season data. Drill targets were selected based on historic information and the IP anomalies identified in the 2013 survey. This was followed in the fall by completion of the three drill holes detailed above.

The Company is planning exploration programs comprised of follow-up core drilling on more advanced targets such as the MAIN Deep and EAST Horizons, as well as reconnaissance geological and geochemical surveys on the various new airborne ZTEM targets. A definite plus for the Silver Hope Property is that it can be road accessed year-round for drilling programs.

** Copper and Gold Equivalents (CuEQ & AuEQ) are calculated using metal price lows over the past one year period and assuming 100% metallurgical recovery and net smelter returns.*

Gold: \$1,400/oz USD; Copper: \$3.00/lb USD; Silver: \$25.00/oz USD.

Atlas East & Pillar East Zones, Pil Property:

In late 2015 the company conducted a brief examination of the Pillar East zone of the Pil property with the primary objective being to follow-up on strong gold-in-soil anomalies. Examination of several anomalous sites resulted in the discovery of mineralized, silicified and quartz veined talus and bedrock containing 2.6 to 8.3g/t gold and 6.5 to 47g/t silver. The historic and

recent anomalous rock and soil samples are aligned north-northeasterly over a length of several hundred meters suggesting this represents an epithermal structure. There is no obvious connection with the Atlas East zone situated approximately 1.5 km to the west. However, the newly discovered Pillar East epithermal Au-Ag mineralization may represent a deeper, structurally controlled zone as opposed to the more widespread and possibly higher level Atlas East mineralization.

While investigating the southern end of the epithermal Au-Ag mineralization, several malachite – azurite (copper) stained volcanic boulders were discovered near the base of a large talus slope. The volcanics contain abundant, disseminated chalcopyrite. Prospecting uphill (southwest) on the slope revealed more copper stained boulders. Four composite rock samples from talus and outcrop assayed from 0.99 to 1.67% Cu and 3.2 to 33.8g/t Ag. The amount and extent of the copper talus is substantial and suggests much more than just a point source. This is supported by two east-west soil lines that revealed highly anomalous copper over a length of 100+ m.

Based on these new discoveries further evaluation of the Pillar East Zone is most definitely warranted.

Previous quarters relating to the Pil Property

In 2005 and 2006, the Atlas East Zone emerged as a new and very exciting epithermal gold-silver exploration target. Surface sampling consistently revealed abundant mineralized talus float and outcrop consisting of silicified, quartz stockwork-veined and brecciated andesite Toadoggon Formation volcanic rocks. Gold-silver mineralization is associated with a prominent rusty gossan zone hosted by pyritic andesite. Gold and silver occurring as electrum, native gold, and argentite have been found in both float and bedrock. Soil and PIMA analysis of the clay-silica minerals suggests the Atlas East Zone lies close to the top of a hydrothermal system. In such systems, high-level clay-silica alteration can pass downward into precious metal mineralization.

In 2006 and 2007 sampling further east of Atlas East resulted in the discovery of anomalous gold and silver in an area referred to as Pillar East. A soil sampling program over the Pillar East Zone delineated a north-northeast trending nearly 500-metre long area of anomalous gold and silver. Soil values range up to 6,748 ppb and 29 ppm respectively. Prospecting and rock sampling within the grid resulted in the discovery of gold and silver mineralization in float and bedrock grading up to 4,650 ppb Au and 102 ppm Ag. Anomalous concentrations of base metals (copper, lead, zinc) were also identified.

Atty Property:

In the third and fourth quarter of 2015, the Atty Property was visited. One objective was prospecting and soil sampling chargeability anomalies along the Titan Induced Polarization line near the property boundary with AuRico Metal's Kemess property. Soil and rock sampling was also conducted over a rusty zone where a rock sample collected in 2013 returned weakly anomalous precious and base metal values. Sampling was also conducted along a ridge in the northeast part of the property that hosts a mineral occurrence.

Previous quarters relating to the Atty Property

The southern portion of the Atty claim (due north of the Kemess property) has a similar geological setting to the Kemess copper-gold deposits. The Company's Titan geophysical survey program during the summer of 2007 identified deep chargeability anomalies potentially indicating that copper-gold porphyry mineralization of the Kemess East Zone being drilled by AuRico Gold may extend onto the Atty property.

In 2013, AuRico Gold completed its feasibility study on the Kemess Underground Zone with the outline of the development of an underground block cave operation with average annual production of 105,000 ounces of gold and 44 million pounds of copper at cash costs of \$213 per ounce of gold, net of by-product credits, over a mine-life of approximately 12 years using base case commodity price assumptions of \$1,300 per ounce for gold, \$3.00 per pound for copper and \$23 per ounce for silver and an exchange rate of US\$/CDN\$1.00.

On December 15, 2014 AuRico Gold announced the discovery of a new porphyry mineralized system that they have named Kemess East. And on January 21, 2015, AuRico further announced an initial resource of 5.5 million Gold Equivalent Ounces at Kemess East bringing the Total Kemess Property (the new Kemess East and pre-existing Kemess Underground) resource to 10.6 million Gold Equivalent Ounces.

On March 23, 2016 AuRico Metals announced a positive feasibility study update on the Kemess Underground reporting a measured & indicated mineral resource estimate of 246,400,000 tonnes containing 1,195,300lbs. of copper grading 0.22%,

3,328,000 ounces gold grading 0.42%g/t and 13,866,000 ounces silver grading 1.75g/t. Also on March 23, 2016, AuRico Metals announced high grade core to the Kemess East Deposit with an indicated only mineral resource estimate of 39,200,000 tonnes total; 344,000,000lbs. of copper grading 0.40%, 627,000 ounces gold grading 0.50g/t, 2,512,000 silver grading 1.99g/t and 7,100,000lbs. molybdenum grading 0.008%.

Since 2006 AuRico has completed 71 drill holes in the Kemess East - 31 of these drill holes since late 2013 (44,633 meters). Most of the mineralized drill intersections on the Kemess East occur between 1.1 and 1.3km from the Atty property border.

Selected Annual Information

The following table sets forth selected audited financial information of the Company for the last three completed financial years:

	Fiscal Years Ended		
	December 31, 2015	December 31, 2014	December 31, 2013
Revenue	\$nil	\$nil	\$nil
Net Income (Loss)	(83,299)	(106,559)	(\$107,396)
Income (Loss) Per Share	(\$0.00)	(\$0.00)	(\$0.00)
Total Assets	7,970,373	\$8,042,413	\$7,769,732
Deferred Income Taxes	1,525,662	\$1,501,382	\$1,428,524
Total Long-Term Financial Liabilities	\$nil	\$nil	\$nil

Summary of Quarterly Results

The following table sets forth selected financial information for each of the last eight most recently completed quarters:

	Quarters Ended			
	December 31, 2015	September 30, 2015	June 30, 2015	March 31, 2015
Revenue	\$nil	\$nil	\$nil	\$nil
(Loss)/Income	(\$44,758)	(\$7,516)	(\$18,442)	(\$12,583)
(Loss)/ Income Per Share	(0.00)	(\$0.00)	(\$0.00)	(\$0.00)
	December 31, 2014	September 30, 2014	June 30, 2014	March 31, 2014
Revenue	\$nil	\$nil	\$nil	\$nil
(Loss)/Income	(\$42,419)	(\$12,702)	(\$39,620)	(\$11,818)
(Loss)/Income Per Share	(\$0.00)	(\$0.00)	(\$0.00)	(\$0.00)

Financial Condition

During the three months ended December 31, 2015, general and administrative expenses for the period were \$7,286 compared to \$8,363 in December 31, 2014. The decrease was primarily due to a decrease of \$76 in office and administration; a decrease in legal and accounting of \$811, and a decrease in trust and filing of \$189.

At December 31, 2015, the Company had Current Assets of \$60,938 (2014 - \$158,563). Deferred mineral property

expenditures for the year totalled \$25,585 (2014 - \$177,100). The Company's working capital was \$52,210 (2014 - \$136,814).

There has been no change in the nature or manner in which business is conducted nor in business conditions which would affect the Company's financial results. All results are reported in Canadian dollars.

Capital Resources and Liquidity

The Company is in the exploration stage and therefore has no cash flow from operations. At December 31, 2015, the Company had cash and cash equivalents of \$56,691 (2014 - \$145,227).

At present, the Company's operations do not generate cash flows and its financial success is dependent on management's ability to discover economically viable mineral deposits. The mineral exploration process can take many years and is subject to factors that are beyond the Company's control.

The Company currently has sufficient financial resources to meet its administrative overhead and property commitments going forward and is confident that it can raise additional funds to undertake all of its planned exploration activities.

Investor Relations

The Company took investor relations in-house in August, 2013 and continues to liaise directly with investors. The Company also maintains a website at www.finlayminerals.com for investor reference.

Off-Balance Sheet Arrangements

The Company has no off-balance sheet arrangements.

Subsequent Events

On April 12, 2016 the Company announced the completion of a non-brokered private placement of 5,857,143 units at \$0.035 per unit for proceeds of \$205,000. Each unit consists of one common share and one-half share purchase warrant. Each warrant is exercisable until April 12, 2018 at an exercise price of \$0.05 per share. The units will have a four month hold period expiring August 12, 2016.

Critical Accounting Estimates

A detailed summary of all the Company's significant accounting policies is included in Note 2 of the Company's December 31, 2014 financial statements.

Financial Instruments and Financial Risk

The Company's financial instruments, at December 31, 2015, consist of cash, reclamation deposits, amounts receivable, accounts payable and accrued liabilities and due to related parties. Cash has been classified as financial assets at fair value through profit of loss and is recognized at fair value. Reclamation deposits and amounts receivable have been classified as loans and receivables, the carrying values of which approximate their fair values due to their short term nature. Accounts payable and accrued liabilities and due to related parties are classified as other financial liabilities, measured at amortized cost using the effective interest rate method, however due to their short term nature, their carrying amounts approximate fair value.

Outstanding Share Data

The Company has one class of common share. As at April 29, 2016, there were 68,781,515 common shares outstanding.

No class A or class B preference shares have been issued.

The Company has a stock option plan. As at April 29, 2016, there were 3,450,000 stock options outstanding, all of which have vested.

The Company has 7,886,905 warrants outstanding at April 29, 2016.

RISK AND UNCERTAINTIES

Risks of the Company's business include the following:

Mining Industry

The exploration for and development of mineral deposits involves significant risks, which even a combination of careful evaluation, experience and knowledge may not eliminate. While the discovery of an ore body may result in substantial rewards, few properties which are explored are ultimately developed into producing mines. Major expenses may be required to establish ore reserves, to develop metallurgical processes and to construct mining and processing facilities at a particular site. It is impossible to ensure that the current exploration programs planned by the Company will result in a profitable commercial mining operation.

Whether a mineral deposit will be commercially viable depends on a number of factors, some of which are the particular attributes of the deposit, such as size, grade and proximity to infrastructure, as well as metal prices which are highly cyclical and government regulations, including regulations relating to prices, taxes, royalties, land tenure, land use, importing and exporting of minerals and environmental protection. The exact effect of these factors cannot be accurately predicted, but the combination of these factors may result in the Company not receiving an adequate return on invested capital.

Mining operations generally involve a high degree of risk. The Company's operations are subject to all the hazards and risks normally encountered in the exploration, development and production of ore, including unusual and unexpected geology formations, rock bursts, cave-ins, flooding and other conditions involved in the drilling and removal of material, any of which could result in damage to, or destruction of, mines and other producing facilities, damage to life or property, environmental damage and possible legal liability. Although adequate precautions to minimize risk will be taken, milling operations are subject to hazards such as equipment failure or failure of retaining dams around tailings disposal areas, which may result in environmental pollution and consequent liability.

The Company's mineral exploration activities are directed towards the search, evaluation and development of mineral deposits. There is no certainty that the expenditures to be made by the Company as described herein will result in discoveries of commercial quantities of ore. There is aggressive competition within the mining industry for the discovery and acquisition of properties considered to have commercial potential. The Company will compete with other interests, many of which have greater financial resources than it will have for the opportunity to participate in promising projects. Significant capital investment is required to achieve commercial production from successful exploration efforts.

Government Regulation

The exploration activities of the Company are subject to various federal, provincial and local laws governing prospecting, development, production, taxes, labour standards and occupational health, mine safety, toxic substance and other matters. Exploration activities are also subject to various federal, provincial and local laws and regulations relating to the protection of the environment. These laws mandate, among other things, the maintenance of air and water quality standards, and land reclamation. These laws also set forth limitations on the generation, transportation, storage and disposal of solid and hazardous waste. Although the Company's exploration activities are currently carried out in accordance with all applicable rules and regulations, no assurance can be given that new rules and regulations will not be enacted or that existing rules and regulations will not be applied in a manner which could limit or curtail production or development. Amendments to current laws and regulations governing operations and activities of exploration, mining and milling or more stringent implementation thereof could have a substantial adverse impact on the Company.

Permits and Licenses

The exploitation and development of mineral properties may require the Company to obtain regulatory or other permits and licenses from various governmental licensing bodies. There can be no assurance that the Company will be able to obtain all necessary permits and licenses that may be required to carry out exploration, development and mining operations on its

properties.

Environmental Risks and Hazards

All phases of the Company's mineral exploration operations are subject to environmental regulation in the various jurisdictions in which it operates. Environmental legislation is evolving in a manner which will require stricter standards and enforcement, increased fines and penalties for non-compliance, more stringent environmental assessments of proposed projects and a heightened degree of responsibility for companies and their officers, directors and employees. There is no assurance that future changes in environmental regulation, if any, will not adversely affect the Company's operations. Environmental hazards may exist on the properties on which the Company holds interests which are unknown to the Company at present, which have been caused, by previous or existing owners or operators of the properties. The Company may become liable for such environmental hazards caused by previous owners and operators of the properties even where it has attempted to contractually limit its liability.

Government approvals and permits are currently, and may in the future be, required in connection with the Company's operations. To the extent such approvals are required and not obtained the Company may be curtailed or prohibited from proceeding with planned exploration or development of mineral properties.

Failure to comply with applicable laws, regulations and permitting requirements may result in enforcement actions thereunder, including orders issued by regulatory or judicial authorities causing operations to cease or be curtailed, and may include corrective measures requiring capital expenditures, installation of additional equipment, or remedial actions. Parties engaged in mining operations may be required to compensate those suffering loss or damage by reason of the mining activities and may have civil or criminal fines or penalties imposed for violations of applicable laws or regulations.

Amendments to current laws, regulations and permits governing operations and activities of mining companies, or more stringent implementation thereof, could have a material adverse impact on the Company and cause increases in exploration expenses, capital expenditures or production costs or reduction in levels of production at producing properties or require abandonment or delays in development of new mining properties.

Production of mineral properties may involve the use of dangerous and hazardous substances such as sodium cyanide. While all steps will be taken to prevent discharges of pollutants into the ground water, the Company may become subject to liability for hazards that cannot be insured against.

Commodity Prices

The profitability of mining operations is significantly affected by changes in the market price of gold and other minerals. The level of interest rates, the rate of inflation, world supply of these minerals and stability of exchange rates can all cause significant fluctuations in base metal prices. Such external economic factors are in turn influenced by changes in international investment patterns and monetary systems and political developments. The price of gold and other minerals has fluctuated widely in recent years, and future serious price declines could cause continued commercial production to be impracticable. Depending on the price of gold and other minerals, cash flow from mining operations may not be sufficient. Any figures for reserves presented by the Company will be estimates and no assurance can be given that the anticipated tonnages and grades will be achieved or that the indicated level of recovery will be realized. Market fluctuations and the price of gold and other minerals may render reserves uneconomical. Moreover, short-term operating factors relating to the reserves, such as the need for orderly development of the ore bodies or the processing of new or different grades of ore, may cause a mining operation to be unprofitable in any particular accounting period.

Uninsured Risks

The Company carries insurance to protect against certain risks in such amounts as it considers adequate. Risks not insured against include environmental pollution or other hazards against which such corporations cannot insure or against which they may elect not to insure.

Conflicts of Interest

Certain of the directors of the Company also serve as directors and/or officers of other companies involved in natural

resource exploration and development. Consequently, there exists the possibility for such directors to be in a position of conflict. Any decision made by such directors involving the Company will be made in accordance with their duties and obligations to deal fairly and in good faith with the Company and such other companies. In addition, such directors will declare, and refrain from voting on, any matter in which such directors may have a conflict of interest.

Land Title

Although the Company has obtained title opinions with respect to certain of its properties, there may still be undetected title defects affecting such properties. Accordingly, such properties may be subject to prior unregistered liens, agreements, transfers or claims, and title may be affected by, among other things, undetected defects which could have a material adverse impact on the Company's operations.

Aboriginal Land Claims

No assurance can be given that aboriginal land claims will not be asserted in the future in which event the Company's operations and title to its properties may potentially be seriously adversely affected.

Additional information relating to the Company is available on www.sedar.com.

On behalf of the Board of Directors

"Robert F. Brown"
